Solution

Section A

1.

(d) 2

Explanation:

Since $7 + 3 = 10$

The least prime factor of $a + b$ has to be 2; unless $a + b$ is a prime number greater than 2.

Suppose $a + b$ is a prime number greater than 2. Then $a + b$ must be an odd number and one of 'a' or 'b' must be an even number.

Suppose that 'a' is even. Then the least prime factor of a is 2; which is not 3 or 7. So 'a' can not be an even number nor can b be an even number. Hence $a + b$ can not be a prime number greater than 2 if the least prime factor of a is 3 and b is 7.

Thus the answer is 2.

2.

(c) 60

Explanation:

$$\text{HCF} = (2^3 \times 3^2 \times 5, 2^2 \times 3^3 \times 5^2, 2^4 \times 3 \times 5^3 \times 7)$$

HCF = Product of smallest power of each common prime factor in the numbers

$$= 2^2 \times 3 \times 5 = 60$$

3.

(d) $-\frac{7}{2}$

Explanation:

Product of zeros = $\frac{c}{a}$

$$2 = \frac{(-7)}{k}$$

$$k = \left(-\frac{7}{2}\right)$$

4.

(c) $\frac{13}{2}$

Explanation:

$$\frac{13}{2}$$

5. (a) $-25x + y = 700$

Explanation:

Since, x litres is the extra quantity of milk and y be total expenditure on milk.

$\therefore$ Required linear equation is,

$$700 + 25x = y \Rightarrow y - 25x = 700$$

$$\text{or } -25x + y = 700$$

6. (a) $x^0 = 85^0$ and $y^0 = 55^0$

Explanation:

According to the question,

$$x^0 + y^0 + 40^0 = 180^0$$

$$x^0 + y^0 = 140^0 \dots (i)$$

$$\text{and } x^0 + y^0 = 30^0 \dots (ii)$$

$$\text{and } y^0 = 55^0$$

On solving eq. (i) and eq. (ii),

$$x + y + x - y = 140 + 30$$

$$2x = 170$$

$$x = 85^\circ$$

Putting the value of x in equation (i), we get

$$85^\circ + y = 140^\circ$$

$$y = 140^\circ - 85^\circ$$

$$y = 55^\circ$$

we get $x^\circ = 85^\circ$ and $y^\circ = 55^\circ$

7.

$$(d) k \leq \frac{9}{8}$$

Explanation:

We have, $2x^2 + 3x + k = 0$

For real roots, $D \geq 0$

$$\therefore D = b^2 - 4ac = (3)^2 - 4 \times 2 \times k = 9 - 8k$$

$$\Rightarrow 9 - 8k \geq 0 \Rightarrow k \leq \frac{9}{8}$$

8. (a) 4

Explanation:

$$p(x) = x^2 - 4x + 3$$

$$D = b^2 - 4ac$$

$$= (-4)^2 - 4(1)(3)$$

$$= 16 - 12$$

$$D = 4$$

9. (a) 4

Explanation:

$$a_{20} - a_{15} = 20$$

$$a + 19d - (a + 14d) = 20$$

$$a + 19d - a - 14d = 20$$

$$5d = 20$$

$$d = 4$$

10. (a) 2, 4, 8, 16, ...

Explanation:

In 2, 4, 8, 16, ...

$$d = a_2 - a_1 = 4 - 2 = 2$$

$$\text{And } d = a_3 - a_2 = 8 - 4 = 4$$

$$\text{Also } d = a_4 - a_3 = 16 - 8 = 8$$

Here, the common difference is not the same for all terms, therefore, it is not an AP.

11.

(b) 5

Explanation:

In $\triangle ADE$ and $\triangle ABC$

angle A common

angle D=B angle ($DE \parallel BC$ then, $d = b$)

by AA similarity criteria

$\triangle ADE$ similar $\triangle ABC$.

$$\frac{AD}{DB} = \frac{DE}{BC}$$

$$\frac{2}{3} = \frac{DE}{7.5}$$

$$DE = 5 \text{ cm.}$$

12.

(b) $(0, -10)$ and $(4, 0)$

Explanation:

Let the coordinates of P $(0, y)$ and Q $(x, 0)$.

So, the mid - point of P $(0, y)$ and Q $(x, 0) = M$

Coordinates of M = $\left(\frac{0+x}{2}, \frac{y+0}{2}\right)$

$\therefore$ Mid - point of a line segment having points (x_1, y_1) and (x_2, y_2)

$$= \left(\frac{(x_1+x_2)}{2}, \frac{(y_1+y_2)}{2}\right)$$

Given,

Mid - point of PQ is $(2, -5)$

$$\therefore 2 = \frac{x+0}{2} = 4 = x + 0$$

$$x = 4$$

$$-5 = \frac{y+0}{2} = -10 = y + 0$$

$$-10 = y$$

So,

$$x = 4 \text{ and } y = -10$$

Thus, the coordinates of P and Q are $(0, -10)$ and $(4, 0)$

13.

(c) 1

Explanation:

We have, $l^2 m^2 (l^2 + m^2 + 3)$

$$= (\operatorname{cosec} \theta - \sin \theta)^2 (\sec \theta - \cos \theta)^2 \{(\operatorname{cosec} \theta - \sin \theta)^2 + (\sec \theta - \cos \theta)^2 + 3\}$$

$$= \left(\frac{1}{\sin \theta} - \sin \theta\right)^2 \left(\frac{1}{\cos \theta} - \cos \theta\right)^2 \left\{\left(\frac{1 - \sin^2 \theta}{\sin \theta}\right)^2 + \left(\frac{1 - \cos^2 \theta}{\cos \theta}\right)^2 + 3\right\}$$

$$= \frac{\cos^4 \theta}{\sin^2 \theta} \times \frac{\sin^4 \theta}{\cos^2 \theta} \left\{\frac{\cos^4 \theta}{\sin^2 \theta} + \frac{\sin^4 \theta}{\cos^2 \theta} + 3\right\}$$

$$= \cos^6 \theta + \sin^6 \theta + 3 \cos^2 \theta \sin^2 \theta \times 1$$

$$= \{(\cos^2 \theta)^3 + (\sin^2 \theta)^3 + 3 \cos^2 \theta \sin^2 \theta (\sin^2 \theta + \cos^2 \theta)\}$$

$$= (\cos^2 \theta + \sin^2 \theta)^3 = 1$$

14. **(a)** 1

Explanation:

$$\sin \theta = \cos \theta$$

$$\sin \theta = \sin(90^\circ - \theta)$$

$$\theta = 90^\circ - \theta$$

$$2\theta = 90^\circ$$

$$\theta = 45^\circ$$

Now

$$\sec \theta \cdot \sin \theta$$

$$= \sec 45^\circ \cdot \sin 45^\circ$$

$$= \sqrt{2} \cdot \frac{1}{\sqrt{2}}$$

$$= 1$$

15.

(b) 2 : 1

Explanation:

$\angle BPA = 90^\circ$ (Angle in semicircle)

In $\triangle BPA$, $\angle ABP + \angle BPA + \angle PAB = 180^\circ$

$$\Rightarrow 30^\circ + 90^\circ + \angle PAB = 180^\circ$$

$$\Rightarrow \angle PAB = 60^\circ$$

Also, $\angle POA = 2\angle PBA$

$$\Rightarrow \angle POA = 2 \times 30^\circ = 60^\circ$$

$$\Rightarrow OP = AP \dots (i)$$

(side opposite to equal angles)

In $\triangle OPT$, $\angle OPT = 90^\circ$

$\angle POT = 60^\circ$ and $\angle PTO = 30^\circ$ [angle sum property of a $\triangle$]

Also $\angle APT + \angle ATP = \angle PAO$ [exterior angle property]

$$\therefore \angle APT + 30^\circ = 60^\circ \Rightarrow \angle APT = 30^\circ$$

$\therefore AP = AT \dots (ii)$ (side opposite to equal angles)

From (i) and (ii), $AT = OP = \text{radius of the circle}$; and $AB = 2r$

$$\Rightarrow AB = 2AT \Rightarrow \frac{AB}{AT} = 2 \Rightarrow AB : AT = 2 : 1$$

16. (a) $\frac{x}{2\sqrt{\pi}}$

Explanation:

Let V_1 be the volume of the cylinder with radius r and height h , then

$$V_1 = \pi r^2 h \dots (i)$$

Now, let V_2 be the volume of the box, then

$$V_2 = x^2 h$$

It is given that $V_1 = 1/4 V_2$. Therefore,

$$\pi r^2 h = \frac{1}{4} x^2 h$$

$$\Rightarrow r^2 = \frac{x^2}{4\pi} \Rightarrow r = \frac{x}{2\sqrt{\pi}}$$

17.

(b) 211

Explanation:

$$\bar{x} = a + \frac{\sum f_i u_i}{\sum f_i} \times h$$

$$= 225 + \frac{-7}{25} \times 50$$

$$= 225 - 14$$

$$= 211$$

18.

(b) 0.95

Explanation:

We know that

$$P(E) + P(\text{not } E) = 1$$

$$\therefore P(\text{not } E) = 1 - P(E)$$

$$= 1 - 0.05$$

$$= 0.95$$

19. (a) Both A and R are true and R is the correct explanation of A.

Explanation:

In $\triangle BDC$

$GF \parallel DC$

$$\frac{BG}{GD} = \frac{BF}{FC} \dots(1) \text{ (By BPT)}$$

In $\triangle DAB$

$EF \parallel AB$

$$\frac{GD}{GB} = \frac{DE}{AE} \text{ (By BPT)}$$

$$\frac{GB}{GD} = \frac{AE}{DE} \dots(2)$$

from (1) and (2)

$$\frac{AE}{DE} = \frac{BF}{FC}$$

20. (a) Both A and R are true and R is the correct explanation of A.

Explanation:

Both A and R are true and R is the correct explanation of A.

Section B

21. $P(x) = 22x(x+1)^2 = 2 \times 11 \times x \times (x+1)^2$

and $Q(x) = 36x^2(2x^2 + 3x + 1)$

$$= 2^2 \times 3^2 \times x^2(2x^2 + 2x + x + 1)$$

$$= 2^2 \times 3^2 \times x^2 \times [2x(x+1) + 1(x+1)]$$

$$= 2^2 \times 3^2 \times x^2 \times (x+1)(2x+1)$$

$$\therefore LCM = 2 \times 11 \times x \times (x+1) \times (x+1) \times 2 \times 3^2 \times x \times (2x+1)$$

$$= 2^2 \times 3^2 \times 11 \times x^2 \times (x+1)^2(2x+1) = 396x^2(x+1)^2(2x+1)$$

22. Let the cost of 1 book be Rs.x and that of 1 pen be Rs.y.

Then, according to the question,

$$5x + 7y = 79 \dots(1)$$

$$\text{and } 7x + 5y = 77 \dots(2)$$

Let us draw the graphs of the equation (1) and (2) by finding two solutions.

These two solutions of the equations (1) and (2) are given below in table 1 and table 2 respectively.

For equation (1) $5x + 7y = 79$

$$\Rightarrow 7y = 79 - 5x \Rightarrow y = \frac{79-5x}{7}$$

Table 1 of solutions

X	6	-8
Y	7	17

For equation (2) $7x + 5y = 77$

$$\Rightarrow 5y = 77 - 7x$$

$$\Rightarrow y = \frac{77-7x}{5}$$

Table 2 of solutions

x	1	-4
y	14	21

We plot the points A(6, 7) and B(-8, 13) on a graph paper and join these points to form the line AB representing the equation (1) as shown in the figure. Also, we plot the points C(1, 14) and D(-4, 21) on the same graph paper and join these points to form the line CD representing the equation (2) as shown in the same figure.

In the figure, we observe that the two lines intersect at the points A(6, 7). So, $x = 6$ and $y = 7$ is the required solution of the pair of linear equation formed, i.e., the cost of 1 book is Rs.6 and of 1 pen is Rs.7.

Therefore the cost of 1 book and 2 pens = $6 + 2 \times 7 = \text{Rs.}20$.

Profit on a table = 10%

$$\therefore \text{Selling price of one table} = y + \frac{10}{100}y = \frac{110}{100}y$$

According to the given condition, we have

If profit on a chair is 10% and on a table is 25%, then total selling price is ₹1535.

$$\therefore \left(x + \frac{10}{100}x\right) + \left(y + \frac{25}{100}y\right) = 1535$$
